

## 18. Code lists / Registers

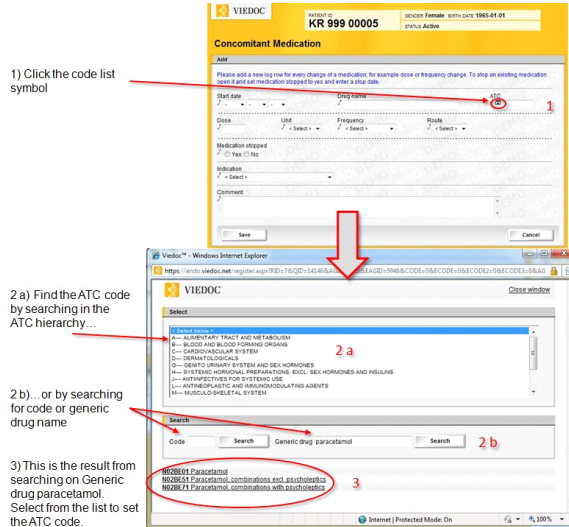

### 1 Code lists

- Some of the code lists used in the endoACRO system are too long to fit in a drop-down list or similar. They also need to be searchable. Code lists of that type are called registers and have a special symbol next to the variable field and are accessible by clicking this symbol.

### 2 Example of searchable code list

- One example of a searchable code list you can find in the Concomitant medication form where there is a code list for the ATC code.
- Click the symbol to open a pop-up window for the ATC register.
- In the pop-up window you can search for the ATC code/drug name in the hierarchical tree view at the top.
- You can also search for the code/drug name by using the search fields for "Code" or "Generic drug".
- To select a ATC code you click at one of the links that appear in the bottom area of the pop-up window.

1) Click the code list symbol

2 a) Find the ATC code by searching in the ATC hierarchy...

2 b) ...or by searching for code or generic drug name

3) This is the result from searching on Generic drug paracetamol. Select from the list to set the ATC code.
